

current FLAIR, T1, T2
(draft: T1 tile ×3)

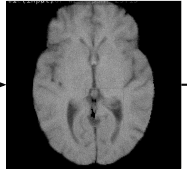

prior T1 & CT1, slices $z-2 \ldots z+2$
registered with FLAIR/T1/T2 only

same conditioning, input channels of the U-Net at every step

x_1: current T1
(measured, t=1)

U-Net
$\hat{x}_0(x_t)$

x_t, t=0.75

U-Net
$\hat{x}_0(x_t)$

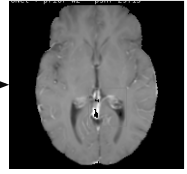

x_t, t=0.5

U-Net
$\hat{x}_0(x_t)$

x_t, t=0.25

U-Net
$\hat{x}_0(x_t)$

$\hat{x}_0$: synthesized CT1
(t=0)

$t = 1$: start at the patient's own anatomy

$t = 0$

20 steps; each: U-Net predicts $\hat{x}_0$, the bridge posterior gives the next x_t
